Package 'adbi'

January 25, 2024

```
ity ('ADBC' <https://arrow.apache.org/adbc/>) accessible from R, an interface compli-
     ant with the 'DBI' package is provided, using driver back-ends that are implemented in the 'adbc-
     drivermanager' framework. This enables interacting with database systems using the Ar-
     row data format, thereby offering an efficient alternative to 'ODBC' for analytical applications.

dbFetch_AdbiResult
dbSendQueryArrow_AdbiConnection

adbi 3

Description

In order to open a database connection, DBI::dbConnect() dispatches on a driver object, which can be instantiated by calling adbi().

Usage

```
adbi(driver = NA_character_)

## S4 method for signature 'AdbiDriver'
dbConnect(drv, ..., bigint = NULL)

## S4 method for signature 'AdbiConnection'
dbDisconnect(conn, force = getOption("adbi.force_close_results", FALSE), ...)
```

Arguments

driver	A driver specification that can be evaluated (with no arguments) to give an adbcdrivermanager::adbc_driver(). See Details for more information.
drv	an object that inherits from DBIDriver, or an existing DBIConnection object (in order to clone an existing connection).
	Extra arguments passed to dbConnect() are forwarded to adbcdrivermanager::adbc_database_init(
bigint	The R type that 64-bit integer types should be mapped to, default is bit64::integer64, if bit64 is installed and character otherwise
conn	A DBIConnection object, as returned by dbConnect().

Details

force

To specify the type of adbc driver, adbi accepts as driver argument

Close open results when disconnecting

- an object inheriting from adbc_driver,
- a function that can be evaluated with no arguments and returns an object inheriting from adbc_driver,
- a string of the form pkg::fun (where pkg:: is optional and defaults to fun), which can be used to look up such a function.

As default, an adbcdrivermanager::adbc_driver_monkey() object is created.

Value

A connection object (S4 class AdbiCOnnection, inheriting from DBIConnection) is returned by dbConnect(), while dbDisconnect() returns TRUE invisibly.

dbFetch_AdbiResult

Examples

```
adbi()
if (requireNamespace("adbcsqlite")) {
   adbi("adbcsqlite")
}
library(DBI)
con <- dbConnect(adbi())
dbIsValid(con)
dbDisconnect(con)
dbIsValid(con)</pre>
```

dbFetch_AdbiResult

Fetch result sets

Description

When fetching results using dbFetch(), the argument n can be specified to control chunk size per fetching operation. The default value of -1 corresponds to retrieving the entire result set at once, while a positive integer will try returning as many rows (as long as n does not exceed the available number of rows), in line with standard DBI expectations. As data transfer is mediated by Arrow data structures, which are retrieved as array chunks, the underlying chunk size can be used by passing an n value NA.

Usage

```
## S4 method for signature 'AdbiResult'
dbFetch(res, n = -1, ...)
```

Arguments

n maximum number of records to retrieve per fetch. Use n = -1 or n = Inf to retrieve all pending records. Some implementations may recognize other special values.

Other arguments passed on to methods.

Value

A data.frame with the requested number of rows (or zero rows if dbFetch() is called on a result set with no more remaining rows).

Examples

```
if (requireNamespace("adbcsqlite")) {
   library(DBI)
   con <- dbConnect(adbi::adbi("adbcsqlite"), uri = ":memory:")
   dbWriteTable(con, "swiss", swiss)
   res <- dbSendQuery(con, "SELECT * from swiss WHERE Agriculture < 30")</pre>
```

```
dbFetch(res)
dbClearResult(res)
dbDisconnect(con)
}
```

dbSendQueryArrow_AdbiConnection

Create result sets

Description

Creating result sets using dbSendQuery() (and by extension using dbGetQuery()) mostly follows DBI specification. One way where adbi deviates from DBI mechanisms is how the bigint setting is not only per connection, but the per-connection setting can be overridden on a result set basis. As default, the connection setting is applied, but passing one of the accepted values as bigint when creating a result set will subsequently use that setting for all fetches using this result set.

Usage

```
## S4 method for signature 'AdbiConnection'
dbSendQueryArrow(
  conn,
  statement,
  . . . ,
  params = NULL,
  immediate = NULL,
  bigint = NULL
)
## S4 method for signature 'AdbiConnection, character'
dbSendQuery(
  conn,
  statement,
  . . . ,
  params = NULL,
  immediate = NULL,
 bigint = NULL
)
## S4 method for signature 'AdbiConnection, character'
dbSendStatement(
  conn,
  statement,
 params = NULL,
  immediate = NULL,
  bigint = NULL
)
```

Arguments

conn A DBIConnection object, as returned by dbConnect().

statement a character string containing SQL.

... Other parameters passed on to methods.

params Optional query parameters (forwarded to dbBind())

immediate Passing a value TRUE is intended for statements containing no placeholders and

FALSE otherwise. The default value NULL will inspect the statement for presence

of placeholders (will PREPARE the statement)

bigint The R type that 64-bit integer types should be mapped to, default is chosen

according to the connection setting

Details

Multiple open result sets per connection are supported and support can be disabled by setting options(adbi.allow_multiple_results = FALSE). If not enabled, creating a new result will finalize potential other results and throw a warning.

Value

An S4 class AdbiResult (inheriting from DBIResult).

adbi-driver

Examples

```
if (requireNamespace("adbcsqlite")) {
   library(DBI)
   con <- dbConnect(adbi::adbi("adbcsqlite"), uri = ":memory:")
   dbWriteTable(con, "swiss", swiss)
   str(
     dbGetQuery(con, "SELECT Examination from swiss WHERE Agriculture < 30")
   )
   str(
     dbGetQuery(con, "SELECT Examination from swiss WHERE Agriculture < 30",
        bigint = "integer")
   )
   dbDisconnect(con)
}</pre>
```
